Around the world, in broadcasting, recording or sound reinforcement, the Compellor is specified more than any other level controller. By throwing away all conventional design ideas, we created audio processing with unprecedented sound transparency, yet is exceedingly effective at controlling levels. Because our designs are patented, no other company has been able to match the performance. Algorithms like our exclusive "DVG", "DRC", and "FDL" have yet to find any rivals. Some Compellors have literally been in 24hour use in the same rack for a decade or longer. When you specify a Compellor, you know it will do its job flawlessly and give you peace of mind. Because of their advanced technology, most of those older units are still in regular use. Since that time, newer models have been produced, still in analog form. Digital technology of today promises many improvements in user interfaces, and sometimes in sound quality, but not in audio processing algorithms. No digital processor can match an analog Compellor for sound quality and effectiveness. Nevertheless, many of today's systems With the model 320D, Aphex brings you just that. You get all the advantages of the analog processor with AES3 connectivity.

The Compellor handles both problems for you, fitting the sound into an ideal sound envelope package. It works differently at different frequencies, for example. It locks up when the sound stops, and resumes instantly when sound reappears. When you listen, you know the levels are made more even, but you don't perceive the levels are shifting. Again, you don't hear "pumping" or other compressor artifacts. Just very natural sound that is evenly consistent in loudness. Extremely peaky sounds will be brought into an envelope that is easy to handle by any analog or digital recording or transportation medium including digital codecs.
